

When you install with LapLockTM PSU, Mother Nature doesn't stand a chance!

Ice Dam Protection

With RoofnadoTM LapLockTM PSU installed, your roof deck, internal roof space and wall cavities remain dry and protected from ice dams. If left unprotected, pooling water can rot your roof deck and supporting beams. Water can seep into your roof space and wall cavities causing serious damage to your valuable home or building.

Warm Roof Zone

Warm air rises from the interior and heats the attic space which in turn melts the snow on the roof.

Cold Roof Zone

Cold outside air keeps this zone along the eaves from warming.

Ice dam detail

Hidden ice dam under snow.

Melt water runs under the ice dam.

Cold outside air enters the soffit vents under eaves.

Water Damaged Roof Deck

The effects of not protecting your roof deck from Ice Dams can be devastating and costly. Safeguard your investment with Roofnado LapLock PSU and rest assured that your roof will remain dry during the worst that Mother Nature can throw at it.

LapLockTM Dual-Locking Lap Seal Technology

With LapLockTM PSU, every lap is protected from water ingress by a *Dual-Action* locking adhesive! The first lock is 3" wide strip of highly sticky adhesive that pressure bonds to the 3" overlap section below it. And the second lock is a 1" wide strip of adhesive that locks upward onto the underside adhesive of the sheet above forming a water-tight seal. Correctly installed with the dual-locking laps, dammed water or wind-driven rain is blocked from penetrating the roof deck.

3" Pressure Bond Zone

1" Lap Lock Zone
